

**Russian Academy of Sciences
Nuclear Safety Institute (IBRAE)
B.Tulskaya 52, 113191, Moscow Russia
<http://www.ibrae.ac.ru>**

Overview of IBRAE Activities

**Prof. Leonid Bolshov,
Director**

IBRAE Origin

- **IBRAE was set up upon the Chernobyl accident to carry out fundamental investigations and independent analysis of nuclear and radiation safety**
- **Decree of the USSR Council of Ministers No2198r, November 3, 1988**

Scientific Directions

- **Safety of Nuclear Power Facilities**
- **Ecological Impact of Nuclear Power Facilities on the Environment and the Population**
- **Emergency Response**

Scientific Directions

- **Safety Concept for Nuclear Submarines
Decommissioning and Utilization Under
Present Situation in Russia**
- **Concept of Nuclear Power Development**
- **Expert Geoinformational Systems for the
Fuel/Power Complex Applications**

New directions

Ecological risks

- **A comparative analysis of ecological risks.**
- **Safety for the nuclear spent fuel treatment.**
- **Methodology of assessing the risk of nuclear fuel cycle.**

New directions

Ecological risks

- **Radiological terrorism (system analysis).**
- **Analysis of normative-legislative base for the environment protection.**
- **Public relations.**

IBRAE Staff

- **Total staff** — **400 persons**
- **Scientific staff** — **306 persons**
- **Doctors of science** — **27 persons**
- **Candidates of science** — **120 persons**

Specialists in:

- **Theoretical and applied physics;**
- **Nuclear power engineering;**
- **Biophysics;**
- **Radioecology;**
- **Computational mathematics;**
- **Informatics.**

Institute Scientific Divisions

- **Division of Physical-Technical Safety Problems of the Fuel-Power Complex Facilities.**
- **Division of Ecological Safety and Radiation Risk.**
- **Division of Mathematical Modeling and Information Technologies.**

IBRAE partners and sponsoring organisations

IBRAE Funding Structure for 1998/1999/2000

- **Russian Academy of Sciences** **15%/15%/15%**
- **Domestic Customers** **35%/50%/55%**
- **Foreign Customers** **50%/35%/30%**

Nuclear safety

- **Probabilistic safety analysis (PSA).** Development of methods and their applications.
- **Deterministic safety analysis.** Development and application of computer codes on NPP safety analysis.

IBRAE Structure:

- **Director.**
- **Deputy Directors.**
- **Scientific Advisory Board.**
- **Scientific Departments.**
- **Dissertation Council.**
- **Base Desk of the Moscow Physical-Technical Institute.**
- **Technical crisis center.**

Institute Scientific Divisions

- **Division of Physical-Technical Safety Problems of the Fuel-Power Complex Facilities.**
- **Division of Ecological Safety and Radiation Risk.**
- **Division of Mathematical Modeling and Information Technologies.**

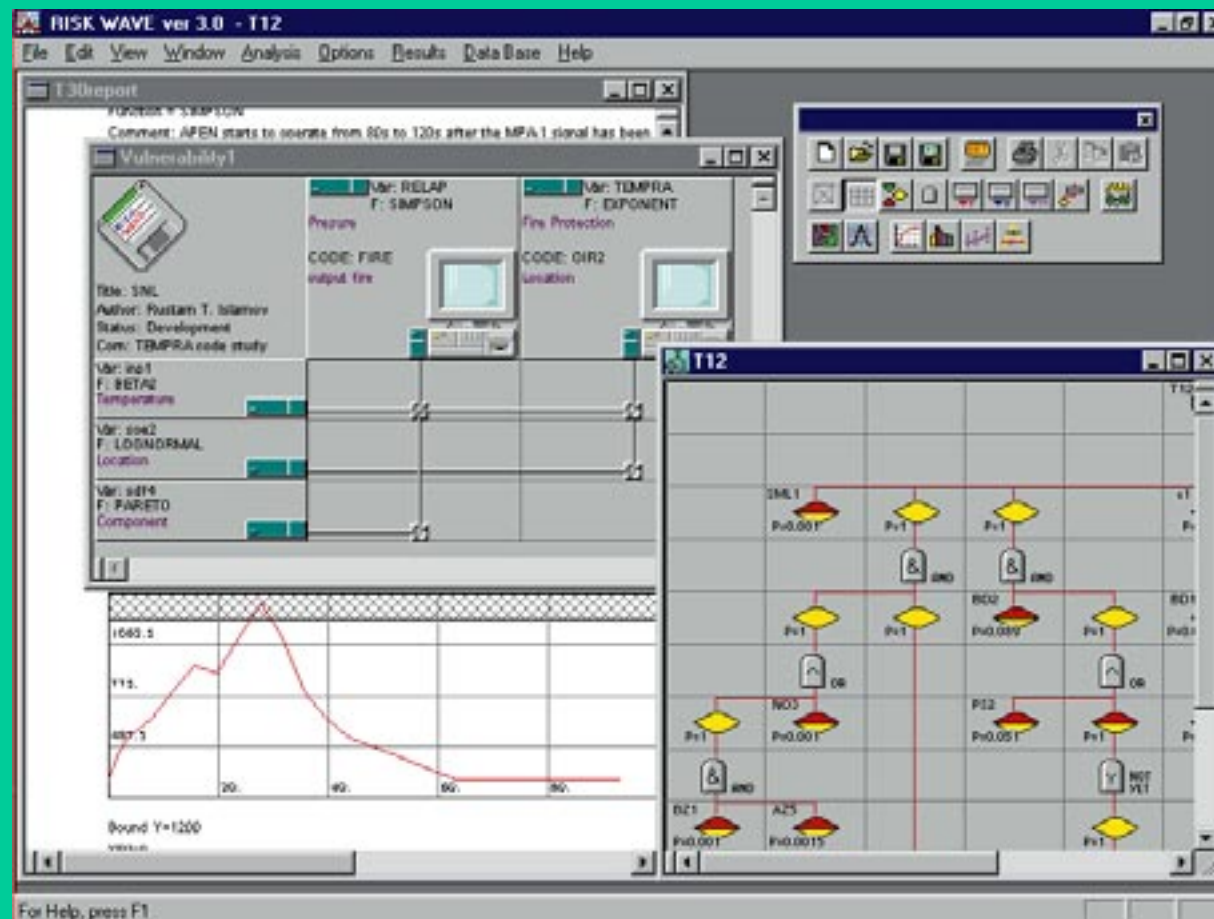

Nuclear safety

- **Probabilistic safety analysis (PSA).** Development of methods and their applications.
- **Deterministic safety analysis.** Development and application of computer codes on NPP safety analysis.

Analytical and statistical method PSA-1

	CORINE, KATS

Physical behavior of containment	
CONT 2D/3D	Sandia 1:6 Kalinin NPP

Containment phenomena	
KUPOL PROBL	

Quenching	
QUENCH	FZK Test QUENCH

Interaction with water	
VAPEX ²	KROTOS FARO

FP behavior out of containment	
Nostradamus	

Development of codes and models with IBRAE participation

Organization	Research area
Nuclear Regulatory Commission (NRC) USA (1992–2002)	Development of the severe-accident models at the NPP, code improvement, evaluation, and verification (MELCOR, SCDAP/RELAP5), consolidation of the severe-accident codes
Institut de Radioprotection et de Sûreté Nucléaire (IRSN) (France) (1992–2001)	Development of the severe-accident models at the NPP, code improvement, evaluation, and verification (ICARE2)
U.S. Department of Energy (1993, 1995–1999)	Analysis of the VVER-1000 containment, PSA, code attestation
OECD 1994–2002	RASPLAV/MASKA project for the interaction of the prototype material melt with the reactor vessel (in collaboration with the RSC «Kurchatov Institute»)
Research Center for Nuclear Safety Karlsruhe (FZK) (Germany)	Interaction of the core materials, experimental program QUENCH
OKBM (Russia) 1991–1999	Safety analysis of the reactor VPBER, low-power reactors
Gosatomnadzor (Russia) 1995–1999	Technical support for Gosatomnadzor within the TACIS projects for the NPP safety
ISTC project, in collaboration with IVTAN and OKB «Gidropress», 1993–1995	Concept of the traps for the NPP with the reactor VVER-1000 based on the high-temperature concrete
«Trap» project for VVER-1000 (in collaboration with RSC «KI», NITI St.PbAEP, REA, AEP)	Crucible trap for the Tien Wang NPP with the reactor VVER-1000
St.PbAEP, OTsRK VNIIEF, OKB «Gidropress», AEP, 1998–2001	Development of the Russian code system RATEG–SVECHA for the analysis of the hydrogen safety
OTsRK VNIIEF 1998–2001	Development of the Russian code system for the analysis of severe accidents

Development of codes and assessing hydrogen sources

Goals:

- Development of code for the advanced estimation of hydrogen safety analysis for the project of Lyan Un Gan NPP (China)

Content of work – development and application of combined code

- Thermohydraulics - RATEG (VNIIEF)
- Early stage of an accident - SVECHA (IBRAE)
- Application - RSC «Kurchatov institute»

Project Core Catcher

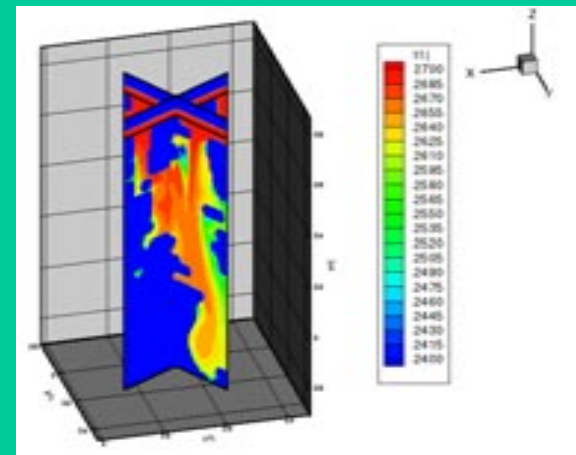

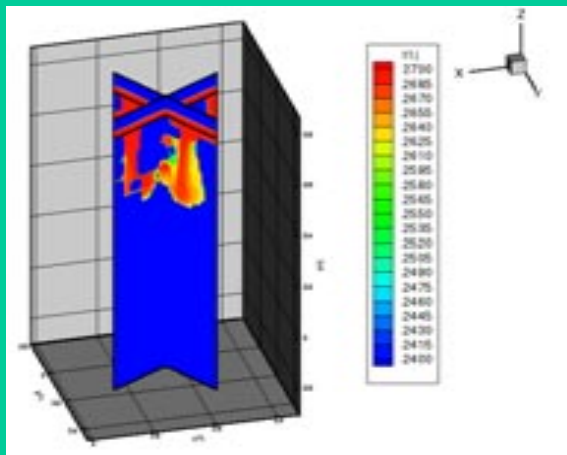

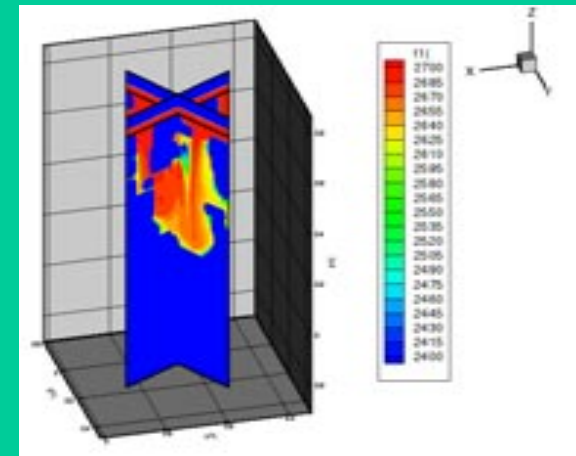

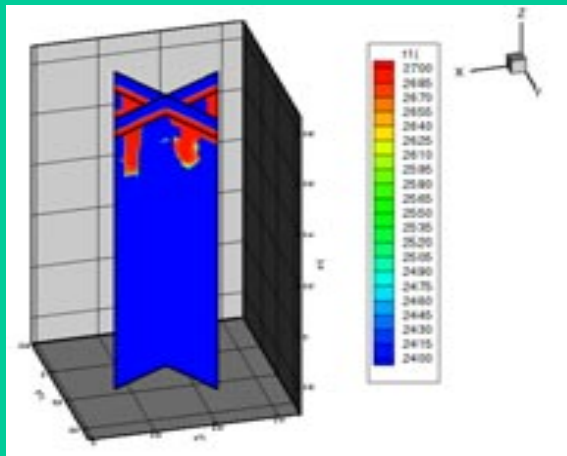

Goals:

Development and application of Russian tools and codes for core catcher validation in the VVER-1000 project of Tyan Van NPP (China) – Atomenergoproekt (S.-Petersburg), RSC «Kurchatov institute», NITI, IBRAE, PhEI

Calculations of processes in catcher using RASPLAV code

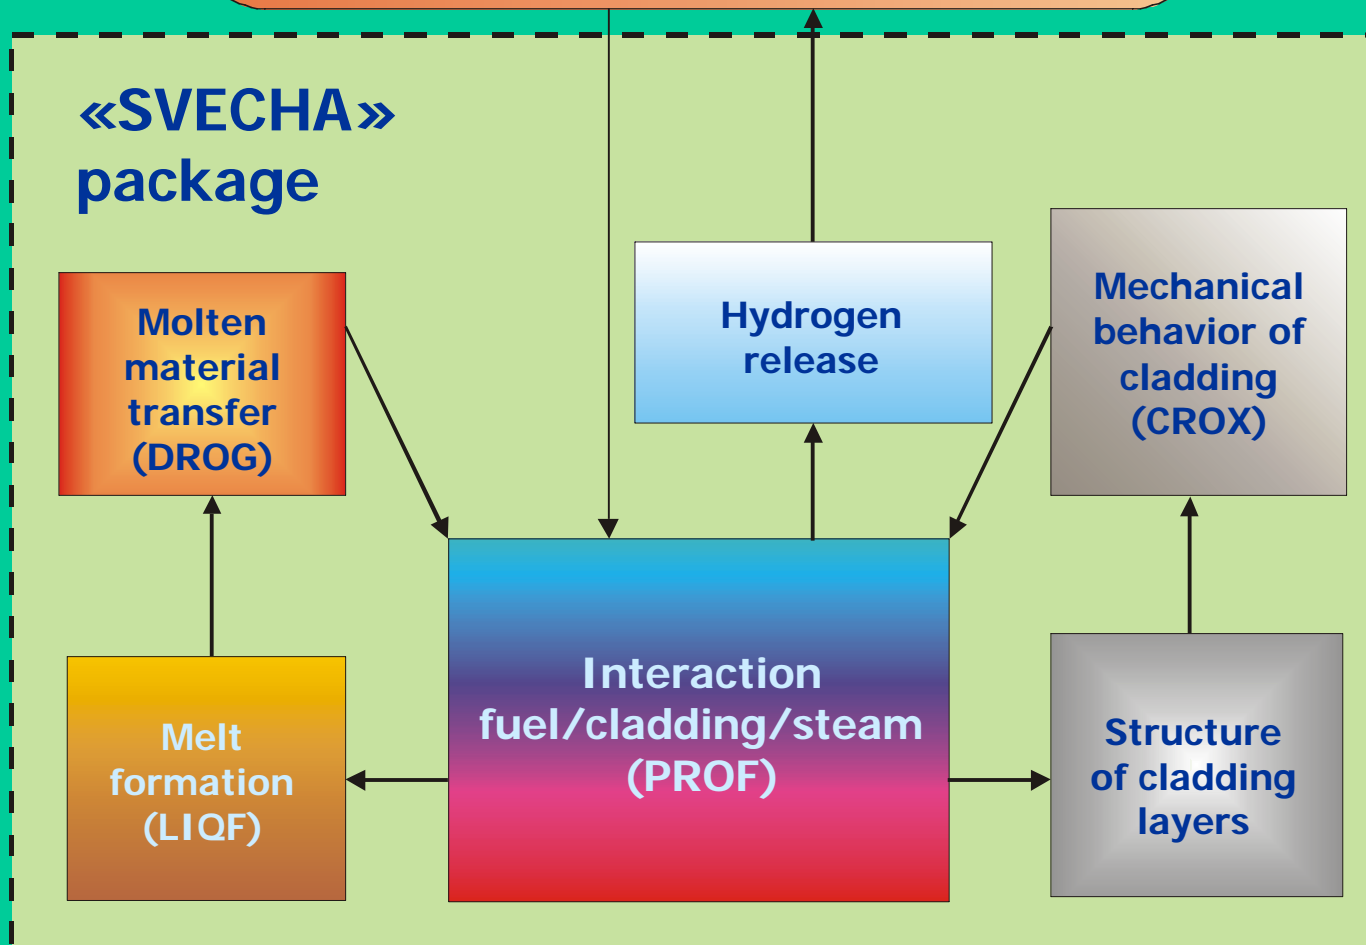

Spreading sacrificial materials in core catcher

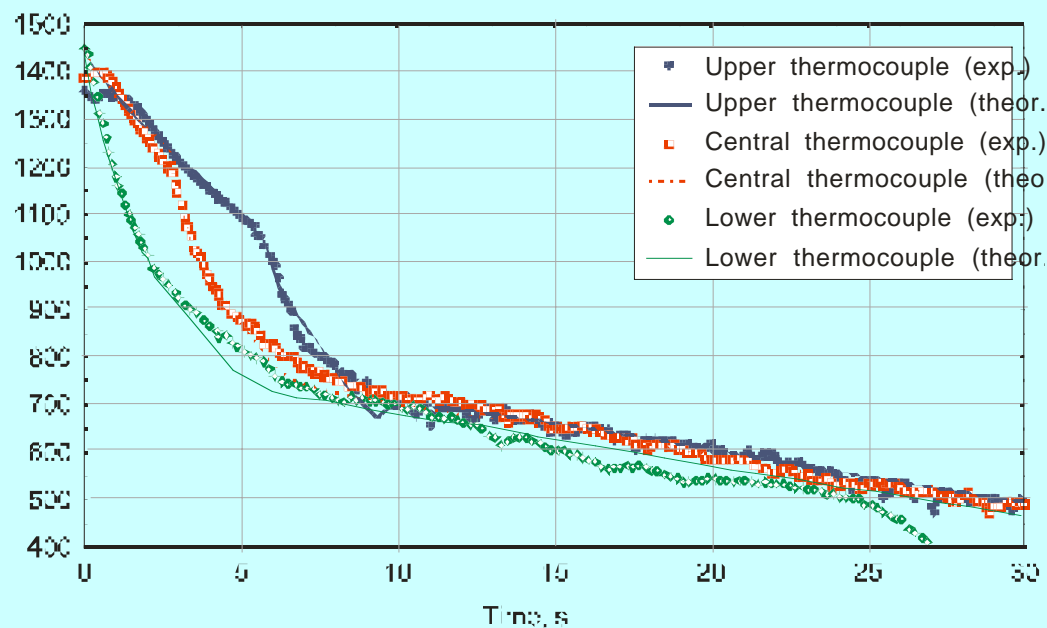

Codes for NPP safety analysis

Thermohydraulic processes

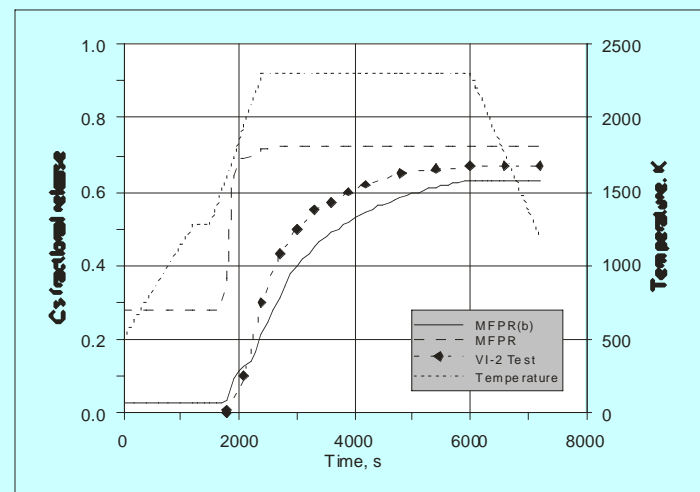

Codes for NPP safety analysis

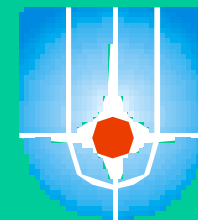

Validation of the SVECHA/QUENCH code package: time dependence of the rod surface temperature

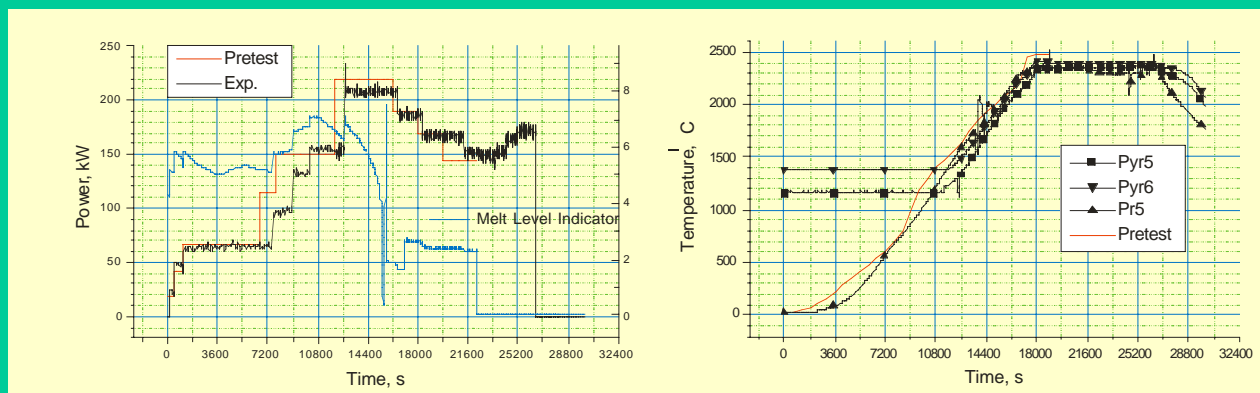

Validation of the MFP code: kinetics of Cs release in the experiment VI-2 (USA)

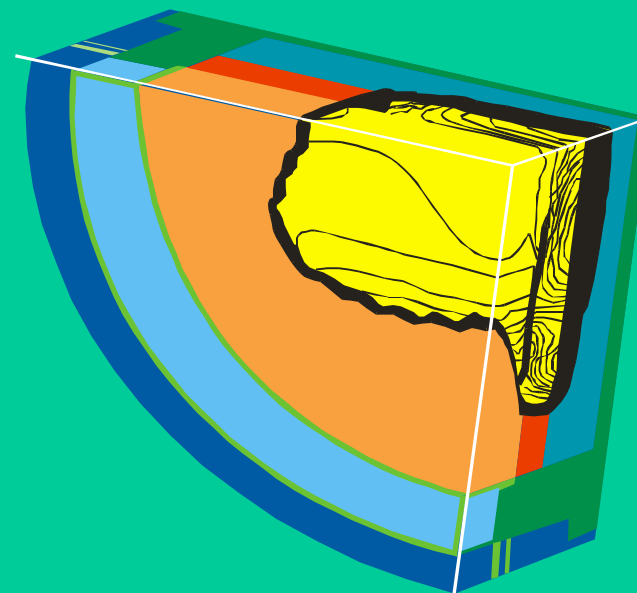

OECD Project «RASPLAV–MASKA»

RSC
«Kurchatov
Institute»

Comparison of the calculated scenario of power injection (left) and corium temperature (right) with the results of AW-4 experiment

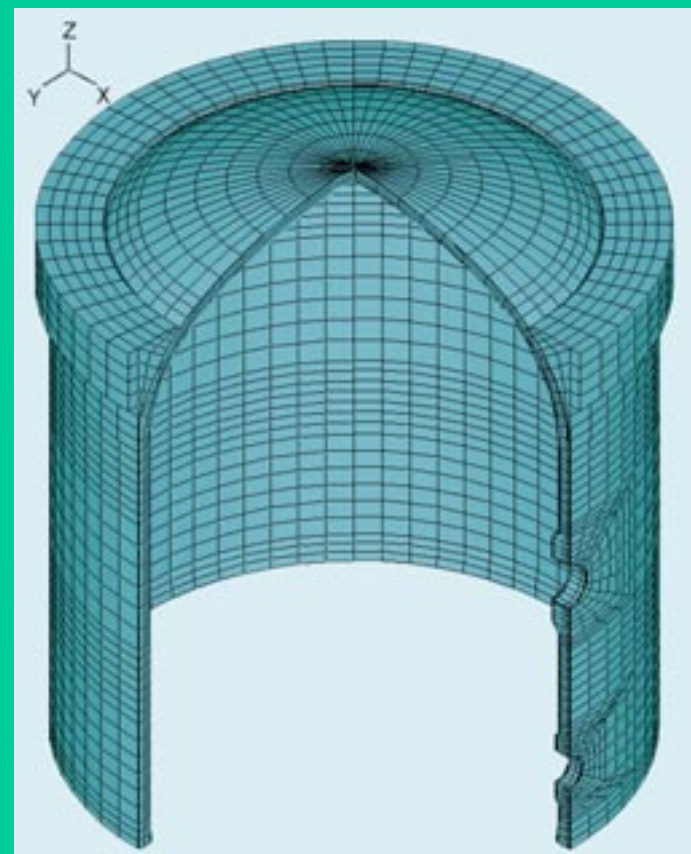

Ingot form and the calculated liquidus isotherm for the experiment AW-200-1

Containment mechanics — CONT code

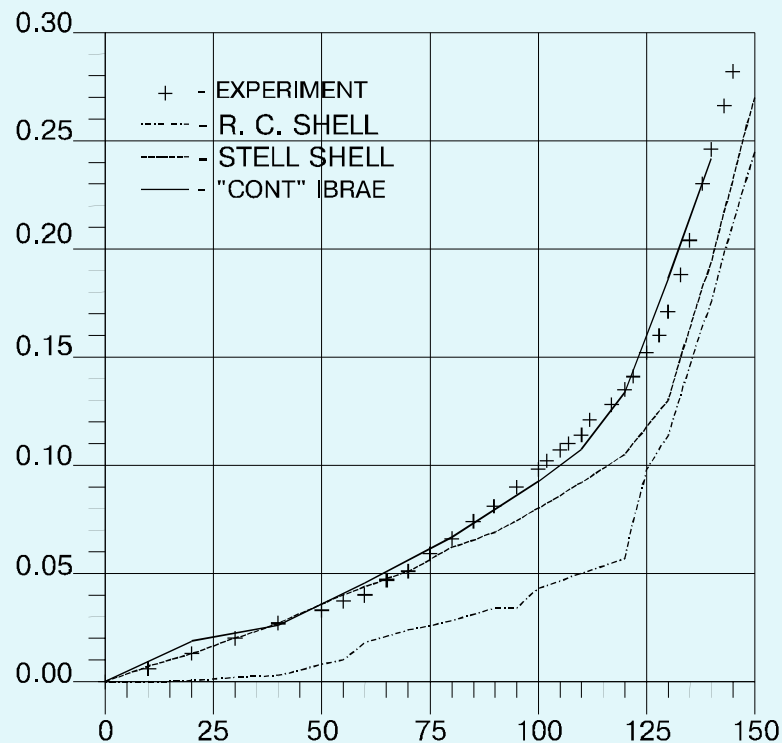

Model of the prestressed
reinforced-concrete containment
(Sandia National Laboratory, USA)
scaled 1:4

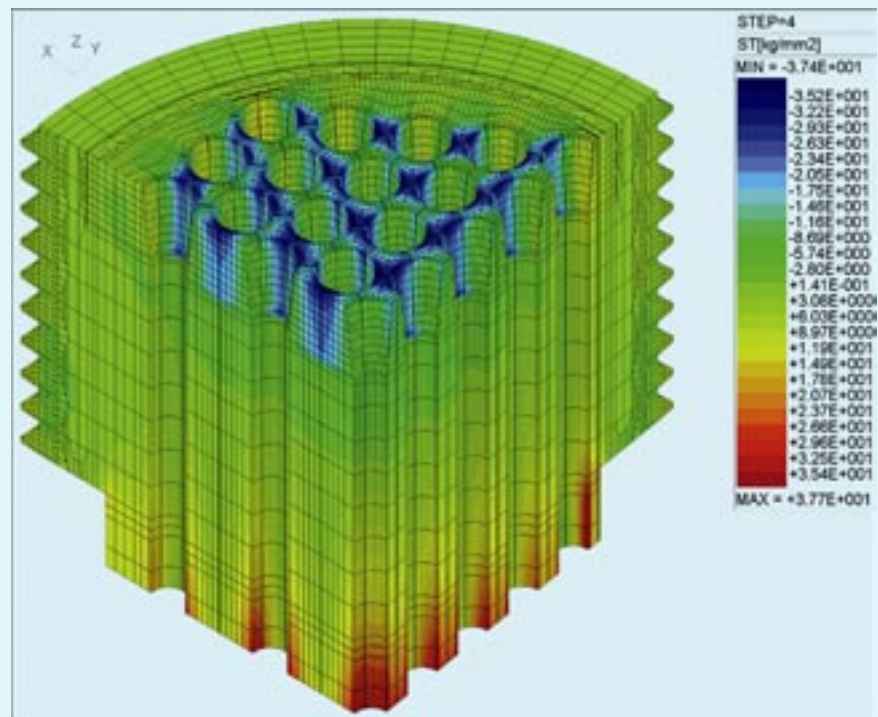

Verification of the CONT code with
the SNL containment scaled 1:6. The
model allows for concrete crusting by
considering reinforcement ropes in
the form of thin sheets

Containment mechanics — CONT code

Modeling of reinforcement ropes in the form of thin sheets enables high-accuracy calculations allowing for concrete crusting

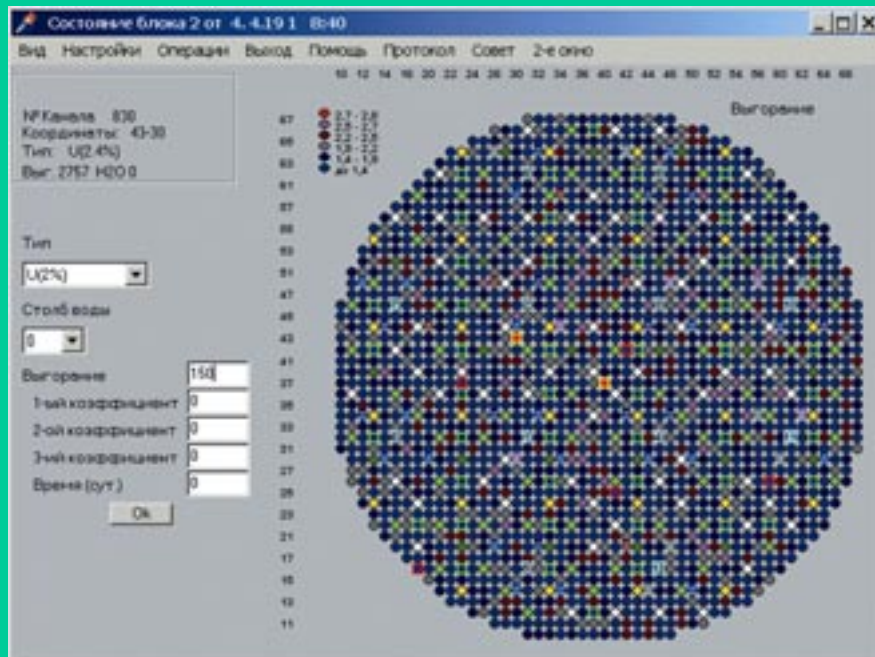

Distribution of the ring tension in the anchor pad under the rope strain
N=1000 t

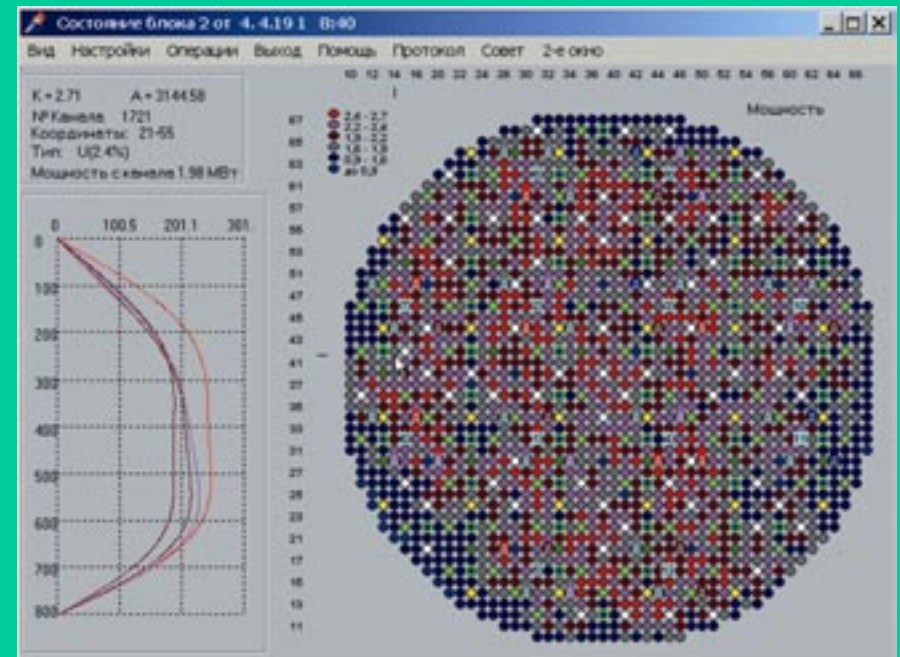

NPP operator support — PROGNOZ code

The PROGNOZ code package was implemented and tested at:
the Ignalina NPP (Lithuania); units 1,2 of the Smolensk NPP;
unit 3 of the Kursk NPP

Fragment of the reloading dialog.
Color indicates the fuel burn-up rate

Map of the channel power release. Curves
show the power distribution along the fuel
assembly axis

Software for processing, analysis, and visualization of information in power industry

Specialized software designed by IBRAE on the basis of the geoinformational systems are aimed at the solution of certain economical and technological problems in power production and distribution

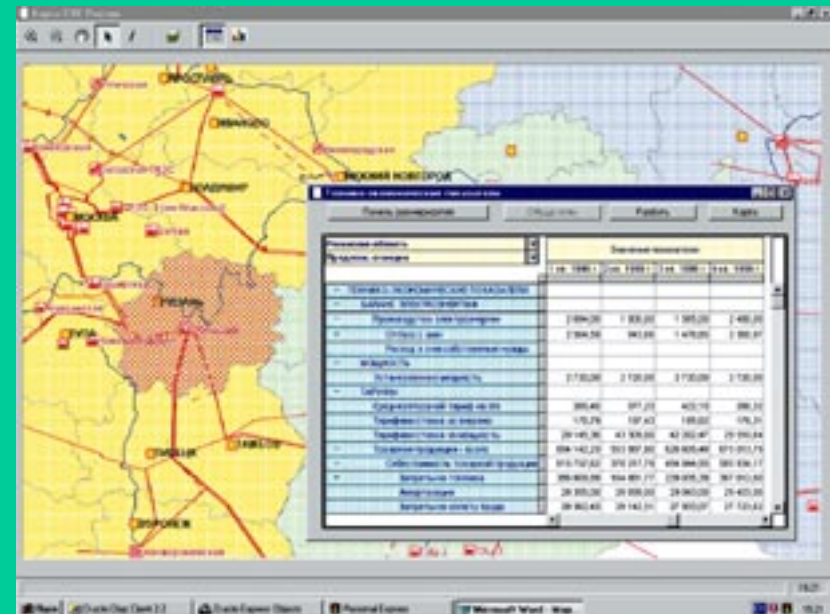

Summary Table:

Показатели	Ед. изм.	Прод. тар. (млрд.)	Стоимость без учета НДС	Стоимость с учетом НДС	Пр. с НДС
Тариф на электроэнергию	руб./кВт.ч	81.85	55.25	66.00	1
Среднемесячный тариф на электроэнергию	руб./кВт.ч	110.44	117.58	136.46	
Стоимость электроэнергии	руб./кВт.ч	80.00	108.21	126.50	
Стоимость электроэнергии с учетом НДС	руб./кВт.ч	80.00	108.21	126.50	

Auxiliary Table:

Показатели	Ед. изм.	прод. без НДС (млрд.)	прод. с НДС (млрд.)	пр. с НДС

Расход электроэнергии объектами	млн.кВт.ч	0	0	0
- на производство электроэнергии	млн.кВт.ч	0	0	0
- на все в % к выработке электроэнергии	%	0	0	0
на производство теплотворности	млн.кВт.ч	0	0	0
- на все в % к выработке	%	0	0	0
Стоимость электроэнергии с НДС	млн.руб.	121.68	240.36	100
Стоимость электроэнергии с НДС в трансформации	млн.руб.	0	0	0
- на все в % к стоимости с НДС	%	0	0	0
Стоимость электроэнергии в сети БЭС БЭС России	млн.руб.	121.68	240.36	100
Стоимость электроэнергии в сети БЭС	млн.руб.	220.89	124.36	0
Стоимость электроэнергии объектами	млн.руб.	0	0	0
- в % к	%	11.28	4.36	0
- на все в % к стоимости с НДС	%	0	0	0
Стоимость электроэнергии	млн.руб.	24.85	114.36	0

Summary and auxiliary tables for rate calculation and analysis

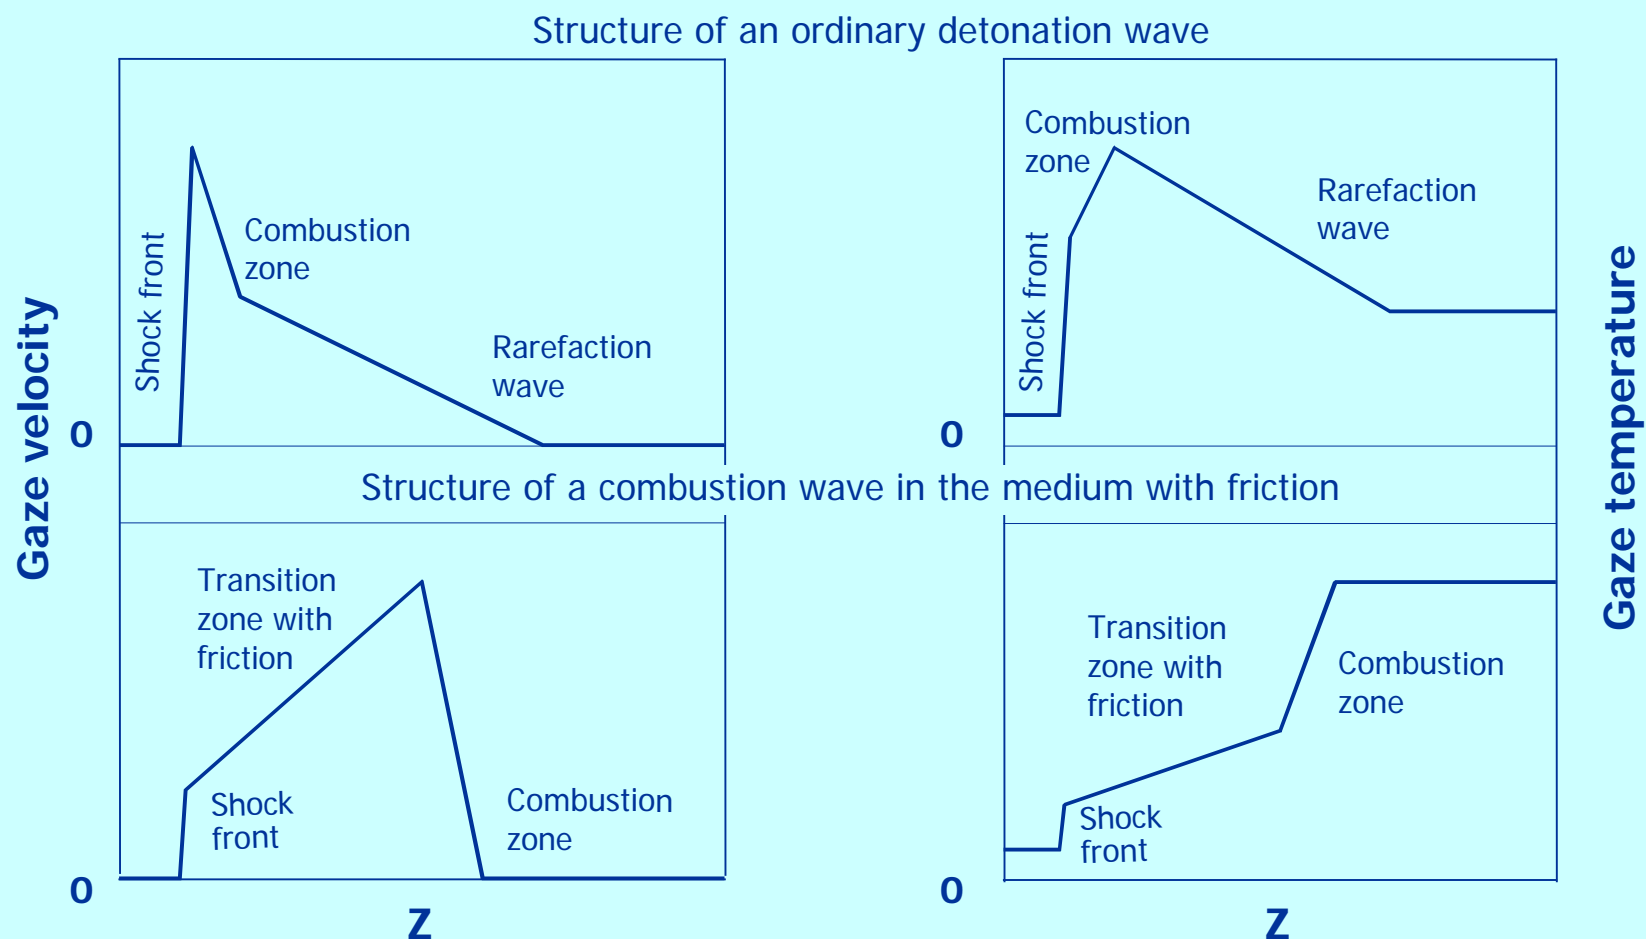

Aggregated power supply and sale data for the specified region

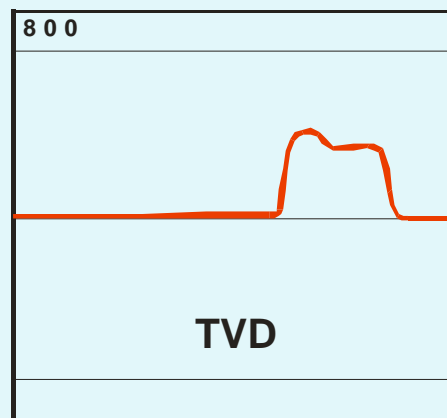

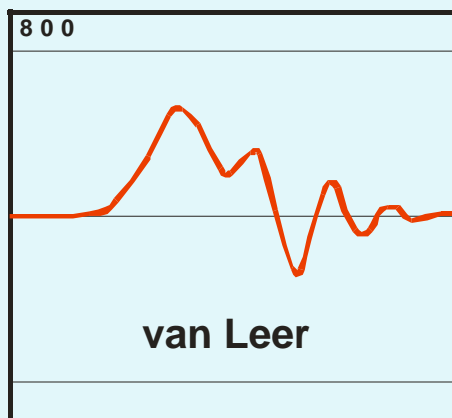

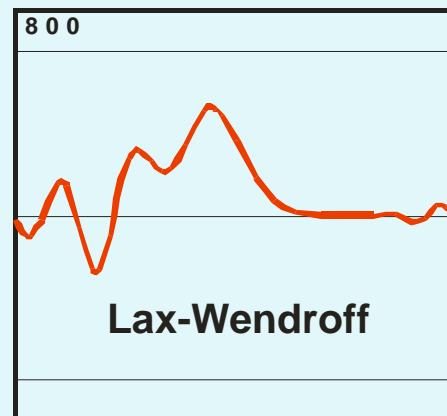

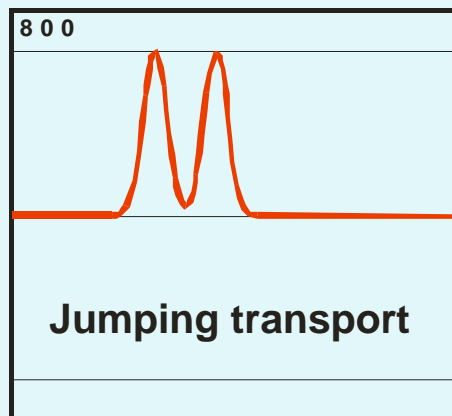

Fundamental researches.

New mechanism of combustion propagation in gaze mixtures

Fundamental researches. Development of new generation of efficient numerical algorithms

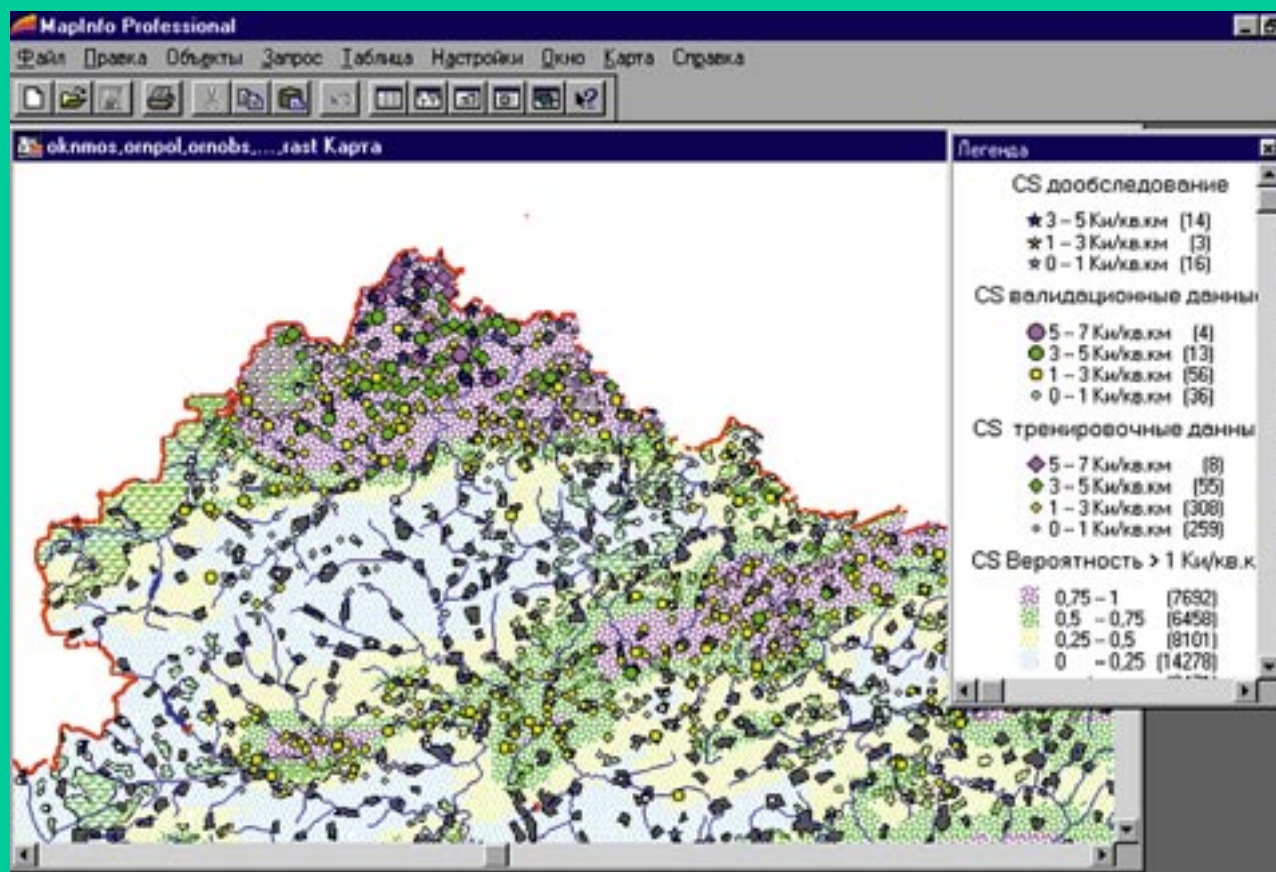

Calculation results for the problem of convective transport upon 800 approximation steps. The jumping transport algorithm exactly reproduces the initial perturbation profile. Other schemes result in catastrophic degradation of the initial profile .

Fundamental researches. Artificial Intelligence methods

The AI methodology for the analysis of the spatially distributed data includes:

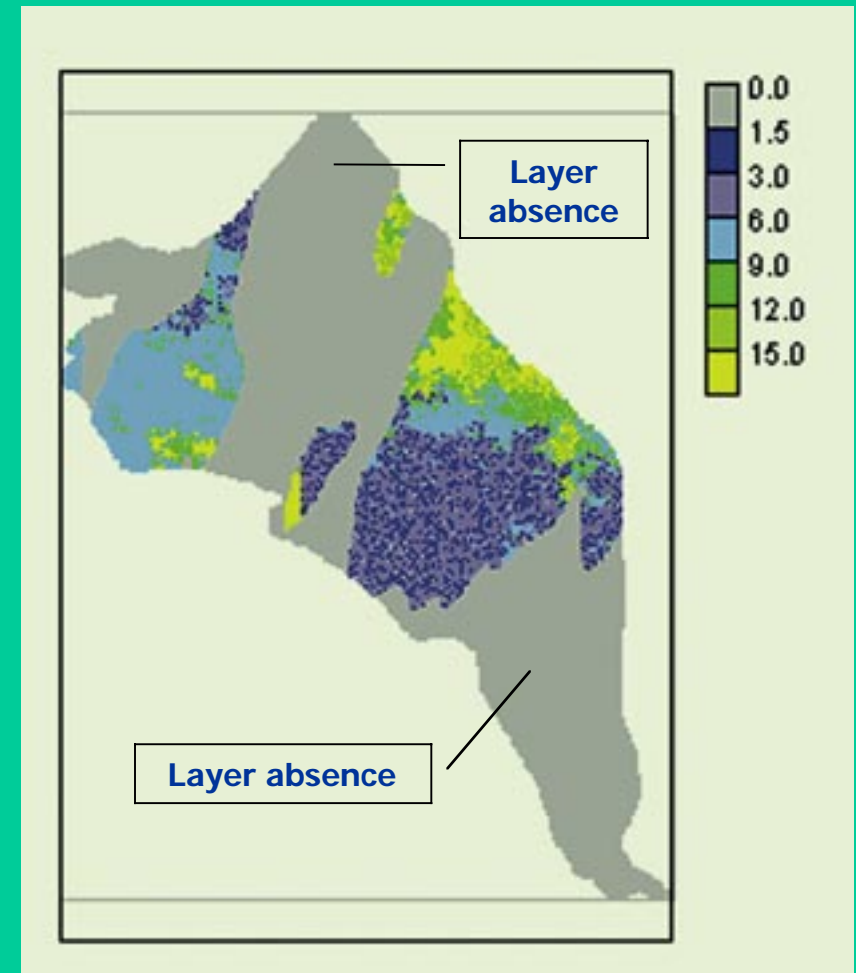

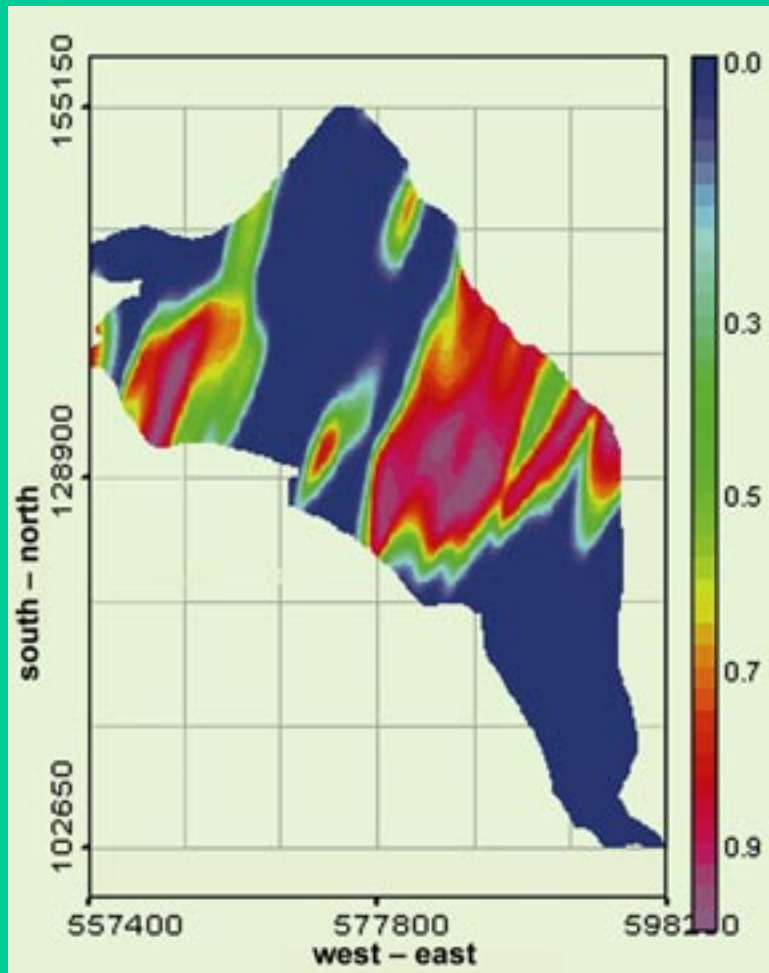

- comprehensive (geometrical, statistical, and fractal) analysis of the monitoring network;
- detailed statistical (global and local) data analysis;
- analysis and modeling of the space correlation structure;
- choice of the optimal method for the data analysis;
- representation of the obtained results in the geographic informational system (GIS).

Results of the probabilistic mapping in the GIS: local probability for the surface concentration of ^{137}Cs exceeding 1 Ci/km²

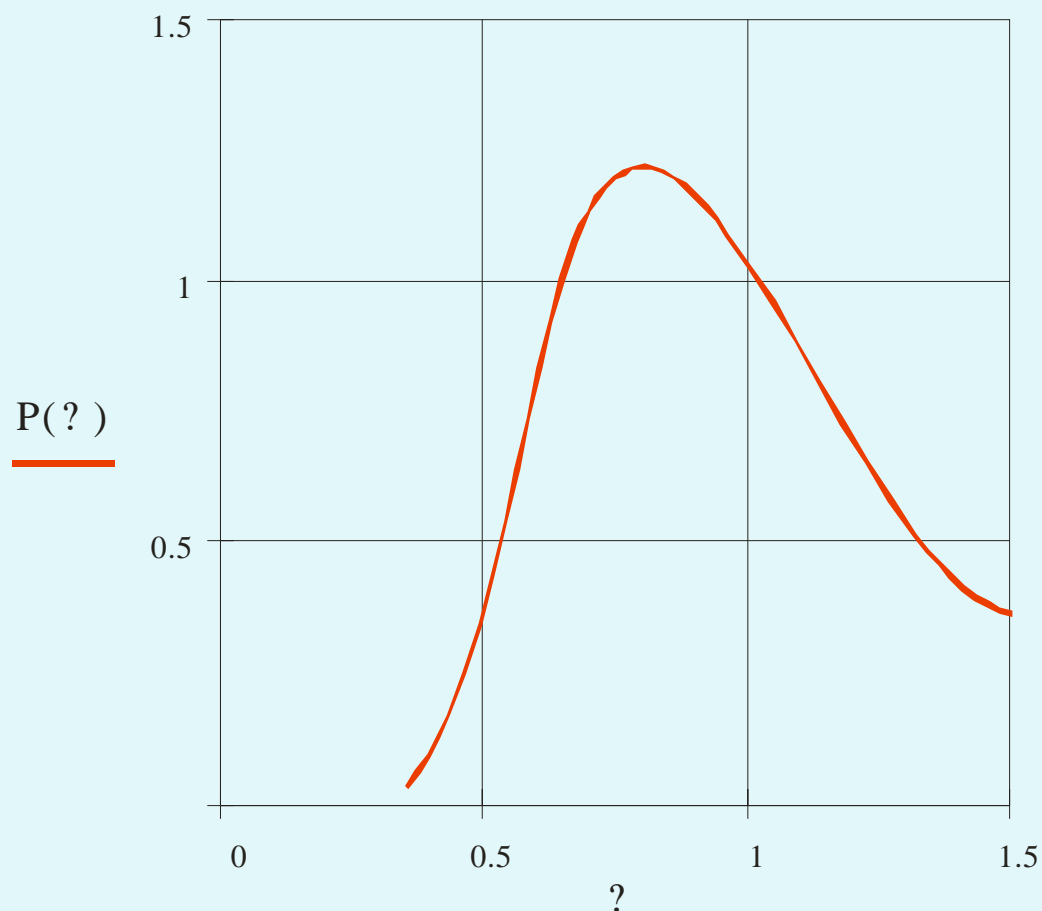

Fundamental researches. Artificial Intelligence methods

Stochastic modeling of the geological layer: the probability to find upper Ringold mud (left) at the Hanford site (USA) and sample realization of the layer depth

Fundamental researches. Contamination transfer in highly disordered media

**Risk factor for the disposition of the radioactive wastes
versus the square of the media interface surface**

Practical experience

System investigation of ecological risks

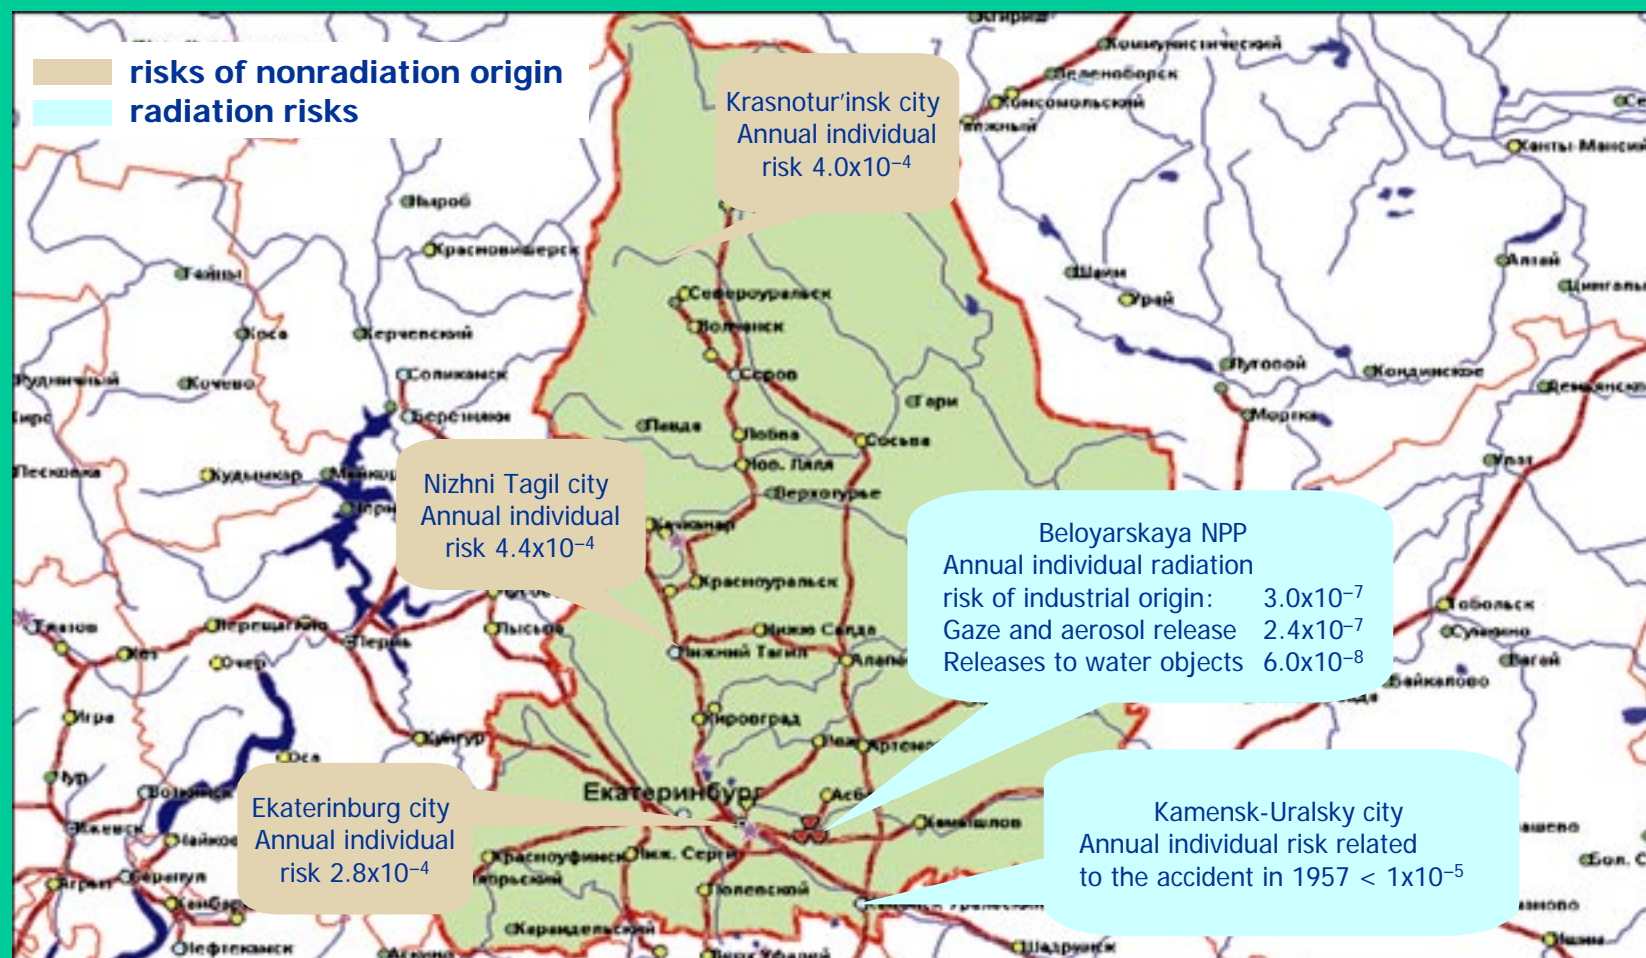

Individual annual mortality risks for the population of Russia

Cause	Subject, mln. persons	Risk	Annual lethal cases
All	69(male)	2.0×10^{-2} (average over 1996–1998)	1 060 000
Accidents	69(male)	3.4×10^{-3} (average over 1996–1999)	240 000
Severe contamination of the atmosphere	70	$10^{-4} - 10^{-3}$	40 000–70 000
Chernobyl NPP resettlement zone	0.1 (contaminated areas in Russia, Ukraine, Belorussia)	$8 \times 10^{-5*}$	8 [*]
Population in the vicinity of «Mayak», nuclear fuel plants	0.9	$6 \times 10^{-6} - 3 \times 10^{-7*}$	<3 [*]
Population in the vicinity of NPP	0.5–1	$7 \times 10^{-7*}$	<0,7 [*]

***hypothetic risks and lethal cases in the low-dose region are calculated within the linear nonthreshold model**

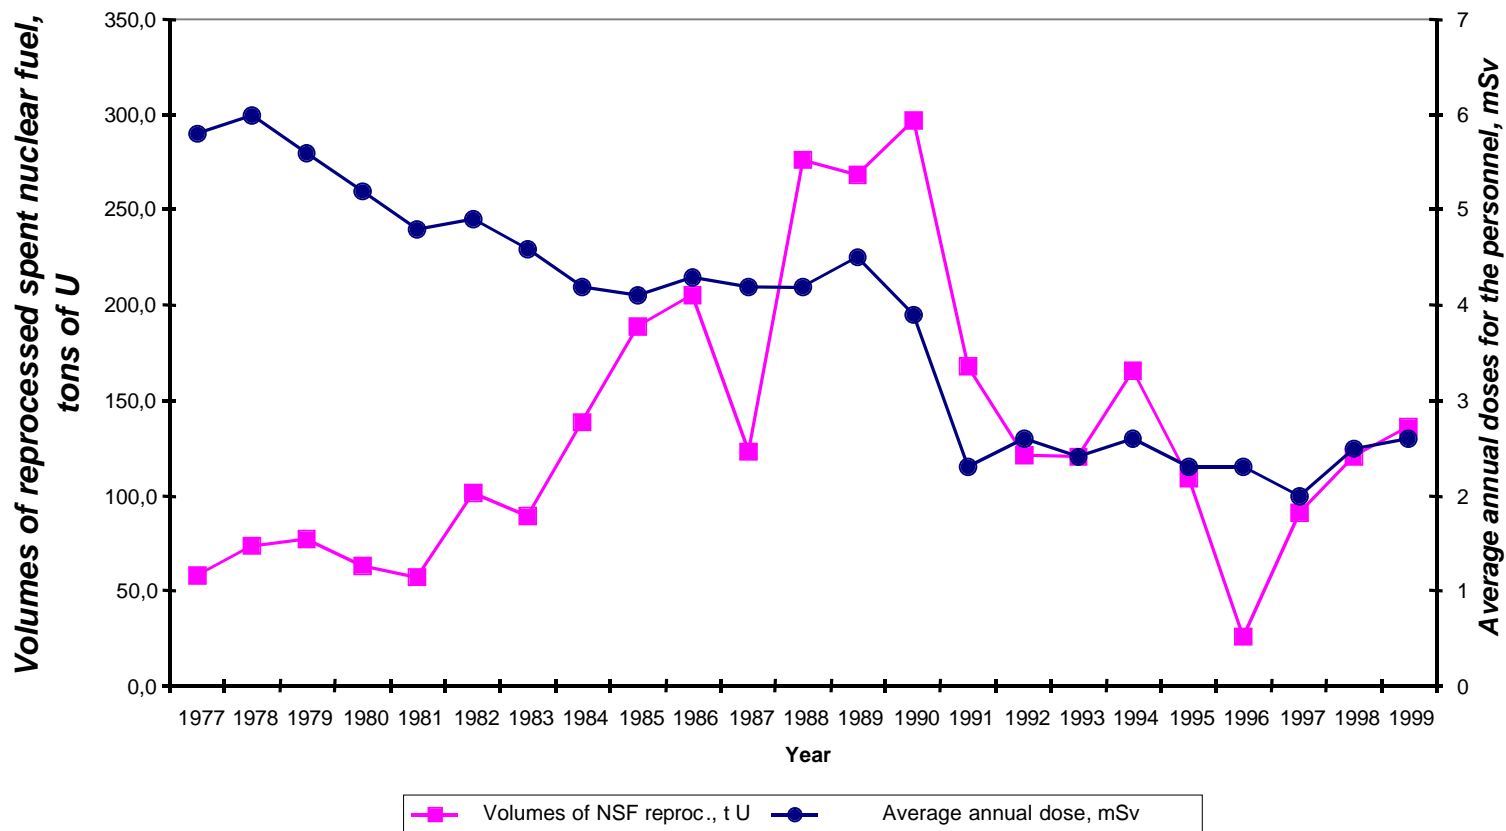

System investigation of ecological risks

Average dose for the personnel of plant RT-1 (reprocessing) is 2.8 mSv/year, of plant RT-2 (storage) - 0.7 mSv/year. Though there are still some reserves for dose decreasing. Recent dose loads for the personnel of plant RT-1 correspond to the dose loads for the personnel of French plants at the beginning of 1990s (before modernization).

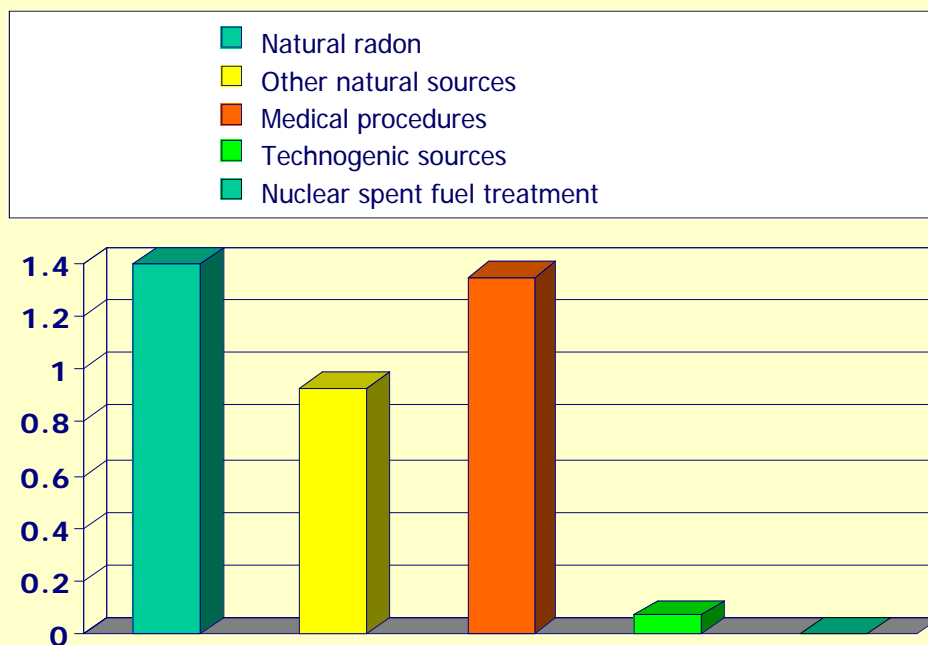

Dynamics of personnel exposure at the “Mayak” plant RT

Radiation risks for nuclear spent fuel treatment

Average annual exposure doses for the population of the Krasnoyarsk Region

Navy nuclear submarines decommissioning dynamics

■ Northern fleet ■ Pacific Fleet ■ Navy

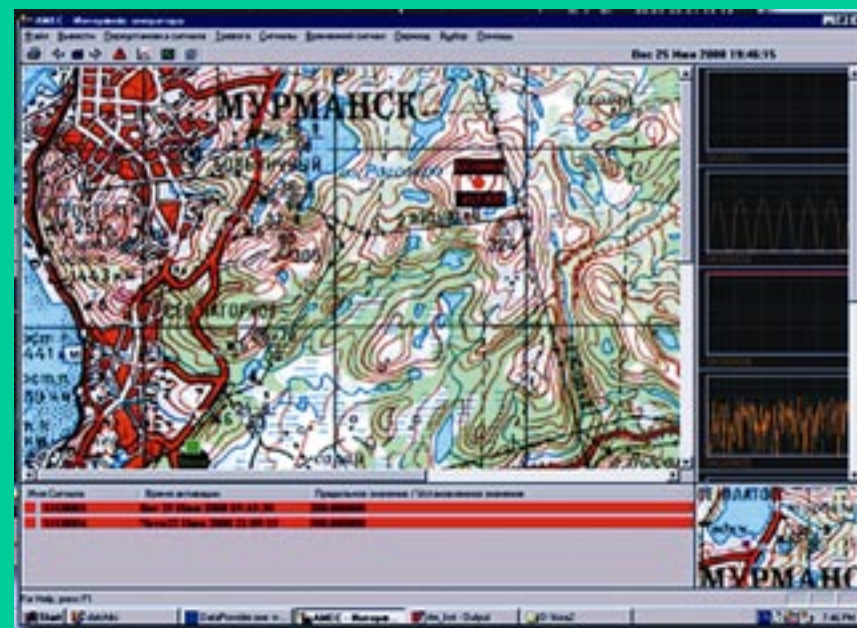

Creation of the radiation monitoring system at the Navy objects (AMEC project)

Structure of the prototype for the information and measurement channel

Dialog screen of the «PICASSO-AMEC» system

Depleted uranium impact

IBRAE researchers participated the activity of the multilateral expert group (MEG) charged to study possible consequences of the DU weapons used by NATO forces in Yugoslavia

Map of aerial bombardment in Kosovo, Serbia, and Montenegro (inset) by the DU-containing ammunition

120mm tank ammunition with DU core in flight

The results of the MEG studies summarized in the special report state that there are no documentary confirmed evidence of an increase in leukemia morbidity and mortality among the NATO military staff and residents in the regions of Bosnia and Kosovo bombed by the DU weapons.

Public relations

The National Information Chernobyl Center performs testing of new forms of informational works — multimedia technologies, which enable visualization of complicated information and attract broad culture aspect to activate the emotional perception component

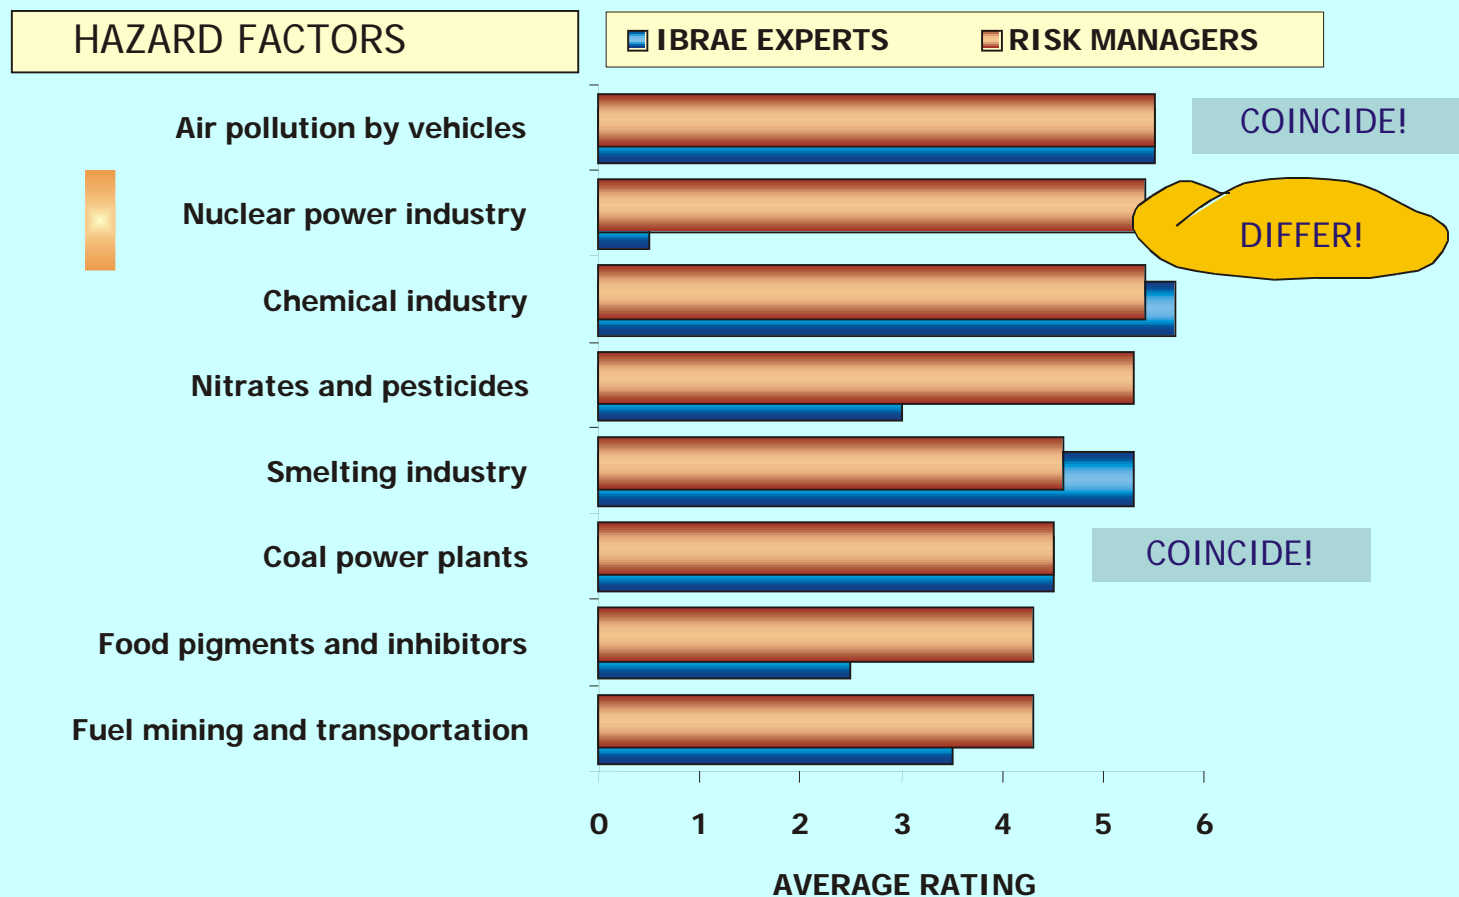

The gained Chernobyl experience helped to understand the reasons of public anxiety related to new nuclear technologies in Russia

Analysis of public opinion

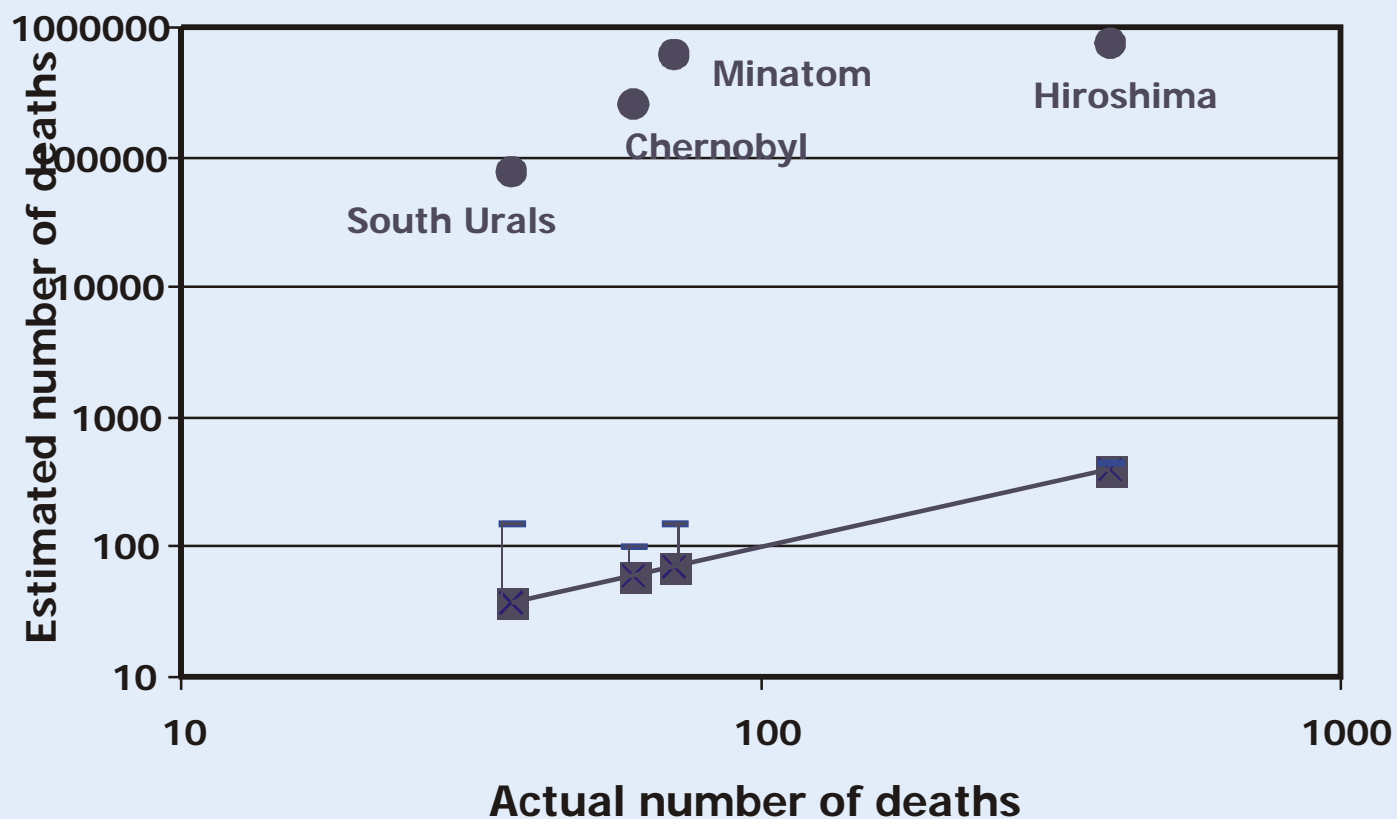

COMPARISON OF ECOLOGICAL HAZARDS

Comparative rating of various hazard factors by risk managers and IBRAE experts. The estimates are in a good agreement for all factors **but nuclear power industry**.

Analysis of public opinion

Results of the poll with the students of the Lomonosov University in Moscow
«What do you know about the distant consequences of radiation accidents?»

Technical Crisis Center at IBRAE

**CCES of the
EMERCOM**

**SCC of the
Minatom of Russia**

**IBRAE Technical
Crisis Center**

**Rosenergoatom
Crisis Center**

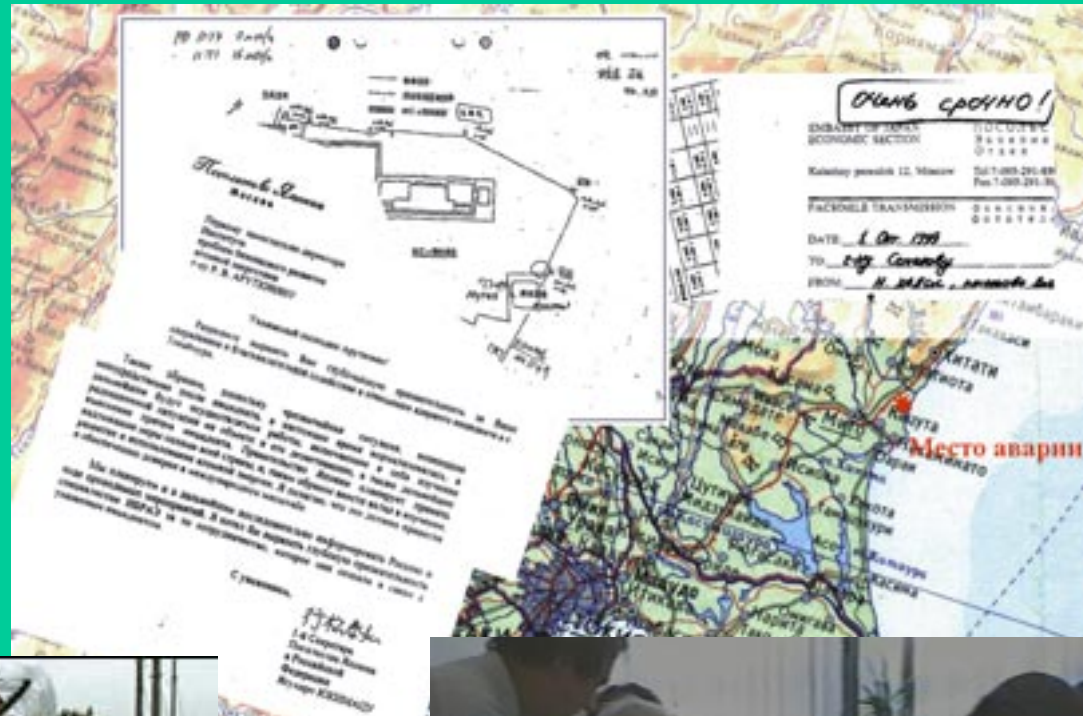

Gosatomnadzor

Interaction between IBRAE TCC and crisis centers of other state bodies

Technical Crisis Center in IBRAE. Tokaimura accident (September 1999)

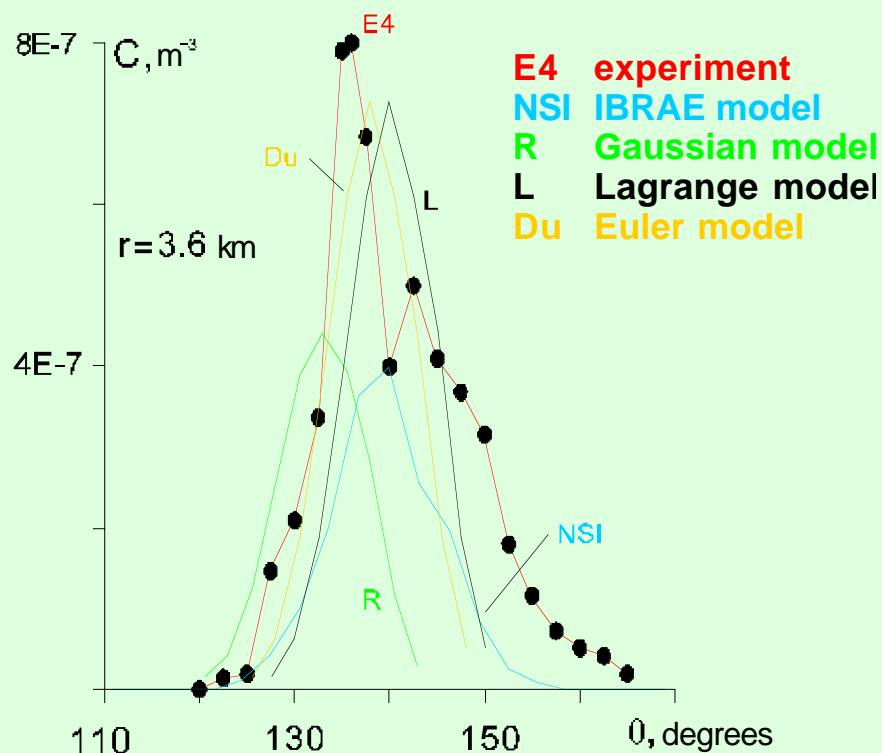

According to the request of the Japan Embassy in Moscow and SCC of the Minatom, TCC IBRAE carried out real-time analysis of the radiation situation, possible consequences, and countermeasures during the accident at the nuclear fuel plant in Tokaimura (September 30, 1999)

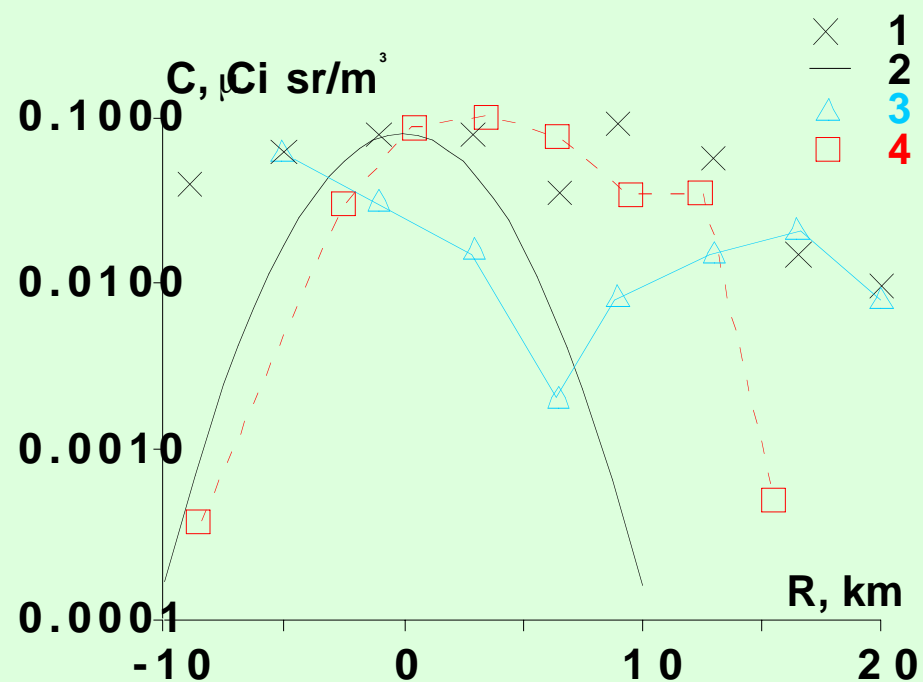

Emergency response. NOSTRADAMUS code package

Comparison of the «NOSTRADAMUS» calculations with the experimental data and other models

Integral surface concentration of a
contaminant

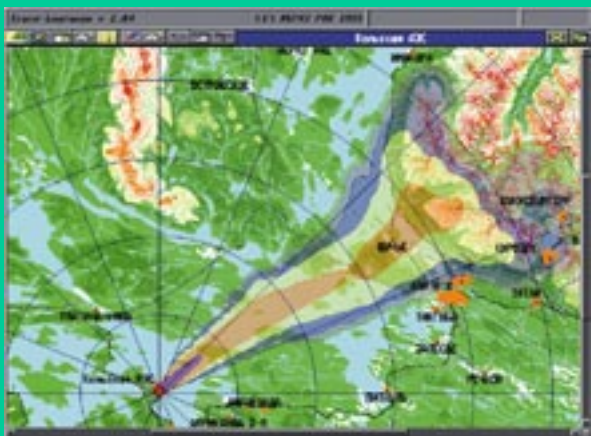

Integral surface concentration of ^{131}I at the
distance 60 km from the source

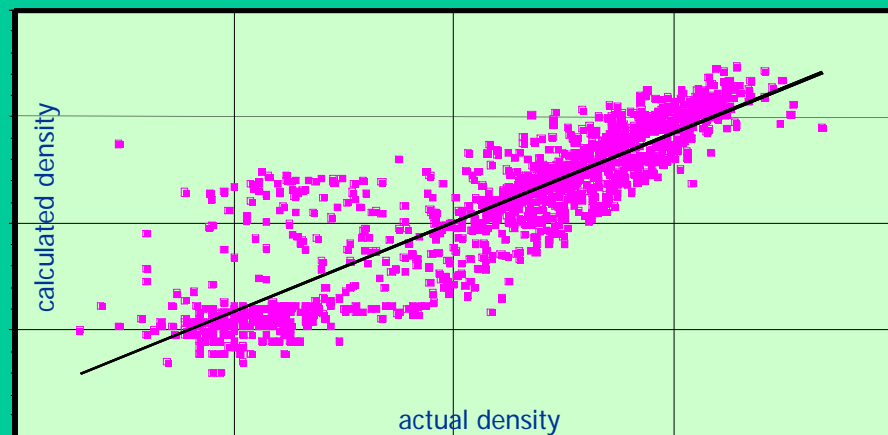

1 — experimental data; 2 — Gaussian model;
3 — ADPIC model; 4 — IBRAE model

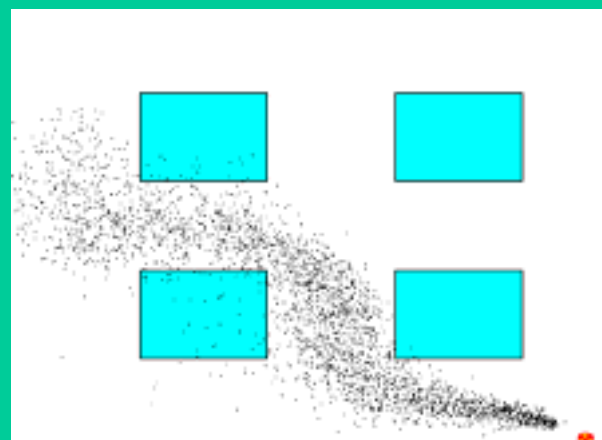

Emergency response. NOSTRADAMUS code package

Contamination density for a conditional accident at the Kola NPP calculated disregarding (top) and allowing for (bottom) the territory relief

Comparison between actual (x) and calculated (y) ^{137}Cs ground contamination density after the Chernobyl accident (log-log scale)

Estimate of the radiological consequences of a radiation accident under urban conditions

Training and Exercises

Starting from 1993, IBRAE participated in preparing and conducting trainings and exercises
